PSP/IS⊙IS Energetic Particle Data - User Guide

November 16, 2020

INTRODUCTION

This user guide contains detailed information on the various quantities measured by the Integrated Science Investigation of the Sun (IS⊙IS) instrument suite on board the Parker Solar Probe (PSP) and how to access them from the data repository. These are the Level 2 data from the EPI-Lo (Energetic Particle Instrument - Low Energy) and EPI-Hi (Energetic Particle Instrument - High Energy) instruments. This document is divided into seven sections, including this introduction and references. Also included in the Introduction is an account of photon contamination (§ 1.3). The terms of using the PSP/IS⊙IS data is presented in § 1.1. The various properties of the solar energetic particles detected in a wide range of energies and the associated attributes such as cadence, energy bins, look directions and sectors in each CDF file that are useful for science analysis are tabulated and presented in § 2. All the variables currently available in the data repository for the scientific community are listed in § 3 and § 4 consists of a compilation of all the information of the variables from the metadata in each CDF file. The variables listed in § 3 are dynamically linked to their detailed descriptions in § 4. The EPI-Lo Decoder Ring is presented in § 5 and a list acronyms in § 6, followed by References.

TERMS OF USE: IS⊙IS DATA

Production of Integrated Science Investigation of the Sun (IS⊙IS) data is funded as part of NASA's Parker Solar Probe mission under contract NNN06AA01C. Use of any IS⊙IS data should include the following acknowledgement and also refer to the publication provided below.

RELEASE NOTES

RELEASE 1

Released 2019-11-15.

Proper analysis of this first release of the data requires knowledge of several caveats and possible instrumental effects.

- Pitch angles are using preliminary calibrations from the FIELDS magnetic field instrument. This may result in errors in pitch angle determination up to about 1.5 degrees.
- EPI-Hi and EPI-Lo data use different units for energies and thus for fluxes. EPI-Hi data are reported MeV for protons and electrons, and MeV/nuc for heavy ions. EPI-Lo uses keV for all species except for time-of-flight only data, which uses keV/nuc. These differences are important when combiningdata across the two sensors.
- Ions heavier than helium and electrons are likely to have substantial background, including from other species, and are thus provided as count rates only until commissioning of these species can be completed for inclusion in a future release.
- EPI-Hi data below approximately 2MeV may be subject to instrumental effects that are currently being quantified. At these energies, the incident energy may be under reported by as much as 10% and the flux may be underreported by as much as 30%.
- EPI-Hi hourly (3600) data is compiled on the hour according to the spacecraft clock. The first integration after turn-on may be substantially shorter than an hour depending on when turn-on occurred. This may result in poor counting statistics from a short integration and unrealistic spectra for this first integration. The same effect is present, but less apparent, for the first integration of shorter periods.
- Spacecraft position is provided for every timebase in a file. Position is in HCI (variable names starting with HCI_R, HCI_Lat, HCI_Lon for each timebase) and HGC (names starting with HGC_R, HGC_Lat, HGC_Lon). Particle flow direction for each look direction is provided as unit vectors in HCI and RTN, as well as pitch angle, also on every timebase; variable names start with HCI, RTN, and PA.

RELEASE 2

Released 2020-01-27.

This release extends the dataset through 2019-10-10 (after third encounter). Files included cover the entire mission; thus it supersedes release 1. Contact the SOC for access to release 1 data if needed for comparison.

- Pitch angles for 2019 use updated FIELDS calibrations. The 2018 pitch angles have not changed from release 1, as FIELDS calibrations from 2018 required no updating.
- The summary product (psp_isois_l2-summary) includes a new variable, A_Heavy_Rate_TS. This is a total heavy-ion count rate from the EPI-Hi LET1A telescope.

RELEASE 3

Released 2020-04-14.

This release extends the dataset through 2020-01-06. This includes the end of Orbit 3 and beginning of Orbit 4, including Venus Flyby 2, but with no new encounter data. Files included cover the entire mission; thus it supersedes previous releases. Contact the SOC for access to release 1 and 2 data if needed for comparison.

- Much of the CDF metadata has been updated to provide better descriptions and make data easier to find. In particular, pitch angle and related pointing data are tagged as `data` rather than `support_data` to make them more visible in many tools. Variable names have not been changed.
- Updated calibration tables for EPI-Lo have been applied. This results in small (a few percent) changes in energy channels and fluxes throughout the mission.

RELEASE 4

Released 2020-08-04.

This release extends the dataset through 2020-04-29. This includes Encounter 4 and the rest of orbit 4. Files included cover the entire mission; thus this release supersedes all previous releases. Contact the SOC for access to release 1-3 data if needed for comparison.

- The EPI-Hi instrument was off for operational reasons from 2019-10-07 through 2020-02-12.
- Due to a dust impact on 2019-04-03 around 16:45Z, look direction 31 of the EPI-Lo TOF-only products (channel T) is highly susceptible to UV photon contamination after this time (see http://dx.doi.org/10.3847/1538-4365/ab643d). Release 3 removed calibrated fluxes for this look direction after this time. In release 4, L31 is also excluded from count rate products that are summed over look direction. This includes `H_CountRate_ChanT_SP` in `psp_isois_l2-summary` and related quicklook plots. This exclusion is for all time, so that rates before and after the dust impact can be compared. Look directions 34 and 35, although they retain intact foils, can also be heavily contaminated by UV and are excluded from summed count rate products as well.
- During the EPI-Lo high voltage ramp-up immediately after turn-on (approximately 15 minutes), count rates and fluxes are not accurate measurements of the incident population. These periods have been filtered out from the flux and count rate variables.
- All pitch angle variables now have a corresponding "spiral angle" variable, containing the angle the particle flow direction makes with the outward nominal Parker Spiral. "Nominal" is defined as 400km/s v_{sw} with corotation breakdown at $10R_S$. For EPI-Lo, these variables are named like `SA_ChanX`; for EPI-Hi, names are similar to `LET1_A_SA` and `LET1_A_R1_SECT_SA` (for non-sectored and sectored rates, respectively.)
- Many small metadata updates have been made for greater clarity; variable names remain the same.

  - EPI-Hi energy unit labeling is consistent (MeV/nuc for ions heavier than protons; MeV for all else) and all energy labels have consistent formatting.

RELEASE 5

Released 2020-09-24.

This release includes data through 2020-04-29, with no additional dates since release 4. This includes Encounter 4 and the rest of orbit 4. Files included cover the entire mission; thus this release supersedes all previous releases. Contact the SOC for access to release 1-4 data if needed for comparison.

- Release 4 was made using the EPI-Lo calibration data from release 2; release 5 uses the latest calibration data. This results in small (a few percent) changes in energy channels and fluxes throughout the mission, similar to release 3.
- Release 4 also included fluxes for look direction 31 of the time-of-flight products after the dust impact on 2019-04-03; these fluxes are largely from UV photon contamination and should not be used. They are properly filtered from release 5.
- EPI-Hi data are the same as release 4, but the files are reproduced in release 5 to avoid confusion.
- IS⊙IS summary data are largely the same as release 4, but may have small changes in energy channels in the variables related to EPI-Lo.

RELEASE 6

Released 2020-11-16.

This release extends the dataset through 2020-08-13. This includes Encounter 5 and the rest of orbit 5. Files included cover the entire mission; thus this release supersedes all previous releases. Contact the SOC for access to release 1-5 data if needed for comparison.

- Data may include brief periods of counts generated internally to the instrument for calibration purposes. These will be filtered in a future release and are noted in the Data Anomalies & Quality list (https://spp-isois.sr.unh.edu/Released-Data-Anomalies-and-Quality-Notes.html).
- Pitch angles for the periods 2019 Jan through Aug and 2020 Jan through Feb were added for this release.

PHOTON CONTAMINATION

EPI-Lo was designed to investigate the physics of energetic particles, however in the special lowest-energy "time-of-flight only" product used in this study, it also responds to solar photons in a subset of approximately sunward–looking apertures lacking special light–attenuating foils. This topic is discussed in detail by Hill et al. (2019) but we provide some details here.

PHOTONS AND DUST

The EPI-Lo design is robust against the detrimental effects of ambient dust or light entering any of EPI-Lo's eighty apertures. The mitigation for light contamination includes employing thicker start foils in the six look directions dominated by photospheric light that is Thomson scattering off electrons near the Sun, and thus visible away from the solar disk where there is no shielding from PSP's thermal protection system (TPS). In addition to thicker foils, we employ baffles and multiple coincidence logic to cut down photon contamination. Also, to protect against dust and resulting dust–hole–admitted light, an extra "collimator foil" was added to all collimator turrets so that pinholes from dust impacts either penetrate only the collimator foil (for the smallest dust grains $\leq$ 100 nm) or only admit light from very tiny solid angles where these holes line up, resulting in a greatly reduced geometry factor for post-impact light contamination than would occur with only one foil. The first dust impact directly detectable by EPI-Lo (i.e., an impact resulting in noticeable light–admitting damage) took place after the second perihelion on 2019–04–03 (DOY 093) 16:45 in the L31 direction (see Figure 2 for description of EPI-Lo look directions). This L31 hole resulted in elevated photon background in one look direction but at a level that has not diminish EPI-Lo's scientific capabilities. This dust impact is discussed in more detail by Szalay et al. (2019).

LOOK DIRECTIONS

We divided the field of view (FOV) into three independent sets of look directions: the generally sunward-looking Bright Look directions with very clear photon viewing (composed of the look directions L22, L25, L34–L37, L44, and L46); the Dim Look directions surrounding the bright area, where there are reduced indications of photons (composed of look directions L24, L26, L27, L41, L45, L47); and the Dark Look direction region, where there is no strong sign of photons (composed of the apertures that are neither the bright look direction or the dim look direction lists and which are mostly composed of wedges W0, W1, and W5–W7, which look away from the Sun). Explicitly, the list of dark look directions is L00–L21, L23, L28–L33, L38–L40, L42, L43, and L48–L79, with the sum of the Bright, Dim, and Dark look directions incorporating all 80 apertures. Although the bright look directions are roughly those most directed at the Sun, an important distinction is that the six apertures closest to the Sun with thicker light-blocking start foils (L23, L30–L33, and L40) are not included in the bright FOV or dim FOV because the thick foils effectively block the scattered light.

ENERGY RANGES

In addition to the division of the FOV, the energy channels are also split into three independent ranges: Low Energy (channels T030 and T031, 1-4 keV/nuc detected energy, based on the TOF measurement, corresponding to incident energies below 34 keV when H is assumed), where accidentals dominate during quiet times; Medium Energy (channels T016–T029, 4-350 keV/nuc detected and 34–370 keV for incident H), where foreground ion measurements are the strongest; and High Energy (channels T001–T015, 350 keV/nuc – 37 MeV/nuc detected and 370 keV – 39 MeV for incident H), where crosstalk events dominate during quiet times. Although the upper energy limit is high, no ions were detected above a few hundred keV/nuc (confirmed by EPI-Hi observations). The reason that accidental coincidences are associated with lower energy intensifications is because randomly distributed start and stop events that accidentally satisfy the TOF logic result in a flat distribution in TOF-space, but because of the inverse square relationship between energy and

TOF, a large fraction of the longer end of the TOF range corresponds to a small, low-energy range of energies.

PROXIES

With these definitions we found that a good proxy for the clean ion signal is found by combining Low Energy/Dark Look Directions, Medium-Energy/Dim Look Directions, and Medium-Energy/Dark Look Directions and a good proxy for photon contamination is the Low-Energy/Bright Look Direction measurements. That is, Ion Proxy = Low Dark + Medium Dim + Medium Dark and Photon Proxy = Low Bright.

SUMMARY

EPI-Lo measures ion intensity, energy, composition, and anisotropy, by design, and also responds to photons that are most likely scattered by zodiacal dust. Utilizing thicker start foils to suppress photon contamination unfortunately degrades low–energy ion response, so this mitigation was used sparingly; consequently, there are several generally sunward apertures with thin start foils where photons produce backgrounds, mostly through accidental coincidence of uncorrelated transmitted photon start and stop triggers. The result is that EPI-Lo responds to SEPs and solar photons, and through directional and energy filtering as well as accidental coincidence calculations, the ion signal can be largely separated from the photon backgrounds, as we have detailed.

SUMMARY: SCIENCE DATA

In this section, the energetic particle measurements of *PSP*/IS⊙IS that are useful for science investigations are presented. The various quantities measured by the EPI-Lo (Energetic Particle Instrument - Low Energy) and EPI-Hi (Energetic Particle Instrument - High Energy) instruments are tabulated in Tables 2.1.1 – 2.2.57.

EPI-LO SCIENCE DATA

Figure 1 shows the EPI-Lo instrument layout and Figure 2 depicts the view of the sky of the 80 apertures. The files containing the EPI-Lo data are named as: <mission>_<suite-instrument>_<data level>_<file-descriptor> (e.g., psp_isois-epilo_l2_ic). There are four primary science data files corresponding to the four modes (depicted by <file-descriptor>) of observation: ion composition (ic), ion energy (ie), particle composition (pc) and particle energy (pe). The tables in this section summarize the science data available for the following EPI-Lo data files:

psp_isois-epilo_l2-ic (ion composition)
psp_isois-epilo_l2-pe (particle energy)

Species without energy ranges specified are measured in this mode but are not yet commissioned. They will be included in future releases.

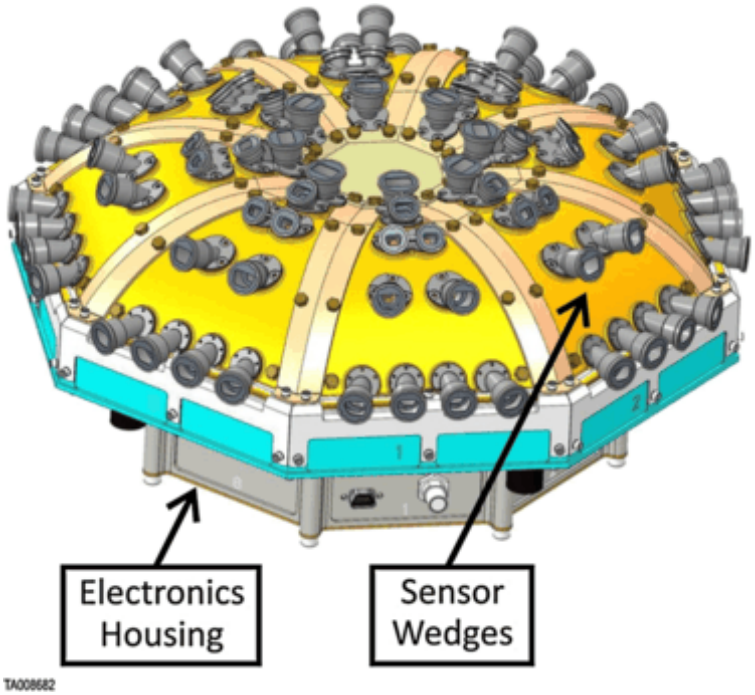

Figure 1: The EPI-Lo Instrument (see McComas et al., 2016, for details).

FILE: PSP_ISOIS-EPILO_L2-IC

This file contains the EPI-Lo ion composition (ic) data for various particle species such as C, Fe, H, ^{3}He, ^{4}He, Mg, O and Si. The variable name is structured as <species>_<quantity>_<channel>, where, <species> is one of the particle species; <quantity> takes 'Counts', 'CountRate' (counts/s) or 'Flux' (cm^{-2} sr^{-1} sec^{-1} keV^{-1}); and <channel> takes one of the values in Column 2. The Columns 'Look Direction' and 'Energy' imply the available look directions (0 – 79) and energy ranges, respectively, in the data file. For details on look directions, see McComas et al. (2016). Examples: C_CountRate_ChanD; H_Flux_ChanT.

EPI-HI SCIENCE DATA

The following tables summarize the science data for the EPI-Hi Instrument. The files are named as: <mission>_<suite-instrument>_<data level>_<file-descriptor> The EPI-Hi instrument consists of three telescopes HET, LET1 and LET2. The HET and LET1 telescopes have two sides (A, B) and let2 has one side (C). Sides A on LET1 and HET look sunward along the Parker Spiral and sides B on LET1 and HET look antisunward. Side C LET2 looks in the spacecraft ram direction. Full pointing information (RTN/HCI) is available in the L2 files (see McComas et al., 2016, and Figure 3). The numerical values following rates in the <file-descriptor> represent the cadence in seconds (e.g., rates10; rates300). If no value is present, the cadence is assumed to be 1 second. Listed below are the EPI-Hi data files. The 60 s cadence products containing only the engineering singles are excluded from public release.

EPI-Hi science rates are accumulated at several cadences. The 10 s and 1 s rates are an encounter–only product. The 60 s rates are also, at a baseline, encounter–only. The 3600 s rates are the main cruise phase product. EPI-Hi produces several engineering rates that overflow their counters when accumulated for 3600 s. For those, a 1/60 sample of the 60 s rates are included in cruise data. The 60 s products are thus produced for the whole mission but those containing no science data are excluded from the public release.

FILE: PSP_ISOIS-EPIHI_L2-HET-RATES10

This file contains the 10 s data of energetic particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for electrons, H, He and NEUT_DET for sides A and B, for different ranges (R1 – R7) of the High Energy Telescope (HET). The naming convention of the variables in the data files is: <side>_<species>_<quantity> for those quantities independent of range. Here, <side> stands for A or B; <species> stands for the particle species (electrons, H, He, etc.); and <quantity> represents Counts (not used in variable names, in general), Flux or Rate. For those parameters

measured as a function of range, the naming convention is: <range><side>_<species>_<quantity>, where, <range> goes from R1 to R7 and <side> takes either A or B. Variable names without ranges (e.g., A_Electrons_Flux) or with double digit range (e.g., R17) have the values integrated over all the available ranges (R1 to R7, in general).
Examples: A_H (measured quantity is "counts"); A_Electrons_Flux; R1A_Electrons_Rate.

Table 2.2.1: PSP_ISOIS-EPIHI_L2-HET-RATES10. The 10 s HET data of particle Counts, Flux and Count Rate for electrons, H, He and NEUT_DET for sides A and B, and for ranges R1 – R7.

FILE: PSP_ISOIS-EPIHI_L2-HET-RATES300

This file provides the 300 s rates of energetic particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for CNO, FeGroup and NetoSi ions for ranges R1 – R7 of the High Energy Telescope (HET) for sides A and B. The variables (summarized in Table 2.2.2) are named as: <side>_<species>_<quantity> for those quantities independent of range. Here, <side> stands for A or B; <species> stands for the particle species (CNO_SECT, FeGroup_SECT and NetoSi_SECT), and <quantity> represents Counts (not used in the variable names, in general), Flux or Rate. Examples: A_CNO_SECT (measured quantity is "counts"); A_FeGroup_SECT_Flux; A_NetoSi_SECT_Rate.

	ENB_SECT - measured quantity is Count; Size 1 X 25; E-bins: 1; E-range: 12 - 12; Sectors: 0 -8 (9).									

Table 2.2.2: PSP_ISOIS-EPIHI_L2-HET-RATES300. The 300 s cadence HET data of particle Counts, Flux and Count Rate for CNO, FeGroup and NetoSi ions for sides A and B, and integrated over ranges R1 – R7.

FILE: PSP_ISOIS-EPIHI_L2-HET-RATES3600

In this file, the 3600 s cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) measured by High Energy Telescope (HET) are available. The names of variables (summarized in Tables 2.2.3 – 2.2.11) follow the general pattern: <side>_<species>_<quantity>, where, <side> stands for A or B; <species> stands for the particle species (Al, Ar, C, etc., in column 2); and <quantity> represents Counts, Flux or Count Rate. Note that "Count" is not used in the variable names, in general. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R17) have the values integrated over all the available ranges (R1 to R7, in general: e.g., B_H_SECT_Flux has values averaged over R1 – R7 in Table 2.2.3).
Examples: A_C, NEUT1, NEUT2_DET, (measured quantity is "counts"); B_FeGroup_SECT_Flux; PENA_C_Rate; R1A_32to50_Flux.

FILE: PSP_ISOIS-EPIHI_L2-HET-RATES60

This file contains the 60-second cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for Al, Ar, C, Ca, Cr, Electrons, Fe, H, He, Mg, N, Na, Ne, Ni, O, S and Si ions for ranges R1 – R7) of the High Energy Telescope (HET) for sides A and B. The measured values are summarized in Tables 2.2.12 – 2.2.20. The variable names follow the structure: <side>_<species>_<quantity>, where, <side> stands for A or B; <species> stands for the particle species; and <quantity> represents Counts (not used in the variable names, in general), Flux or Count Rate. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R17) have their values integrated over all the available ranges (R1 to R7, in general).
Examples: A_Fe (measured quantity is "counts"); B_Electron_SECT_Flux; PENB_Mg_Flux; R7A_Ni_Rate.

FILE: PSP_ISOIS-EPIHI_L2-LET1-RATES10

This file contains the 10-second cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for Electrons, H and He ions for various ranges (R1 – R7) of the Low Energy Telescope (LET1), for sides A and B. The measured values are summarized in Table 2.2.21. The variable names follow the pattern: <side>_<species>_<quantity>, where, <side> stands for A or B; <species> stands for the particle species; and <quantity> represents Counts (not used in the variable names, in general), Flux or Count Rate, for variables independent of range (R1, R2, etc.). The variables for different ranges has the structure: <range><side>_<species>_<quantity>. For electrons, the structure is: <Electrons>_<range><side>. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R17) have the values integrated over all the available ranges (e.g., R1 to R7, in general).
Examples: A_Fe (measured quantity is "count"); Electrons_R6B_Rate; and R1A_He_Rate.

This file contains the 300 s cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for various particle species for ranges R1 & R26 (integrated over ranges R2 to R6) measured by the Low Energy Telescope (LET1), for sides A and B. The measured values are summarized in Table 2.2.22. The variable nomenclature is: <range><side>_<species>_<quantity>, where, <range> denotes the range (R1 to R7), <side> stands for A or B; <species> takes one of the particle species; and <quantity> represents Counts (not used in variable names, in general), Flux or Count Rate. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R26) have the values integrated over all the available ranges (e.g., R2 to R6).
Examples: R1B_NetoSi_SECT_Rate; R26A_CNO_SECT_Flux.

FILE: PSP_ISOIS-EPIHI_L2-LET1-RATES60

This file contains the LET1 (Low Energy Telescope) 60 s cadence measurements of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) of Al, Ar, C, Ca, Cr, Fe, H, He, Mg, N, Na, Ne, Ni, O, S and Si for sides A and B. The values of these variables are summarized in Tables 2.2.33 – 2.2.39. The variables are named as: <side>_<species>_<quantity>, where, <side> stands for A or B; <species> stands for the particle species; and <quantity> represents Count, Flux or Rate ("Count" is not used in the variable names, in general). Variable names without ranges (e.g. A_C) or with double digit range (e.g. R35) have the values integrated over all the available ranges (e.g. R3 to R5).
Examples: A_C_Flux, PENB_C_Rate, R1A_32to50_Flux.

This file contains the 10-second cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for Electrons, H and He ions for various ranges (R1 – R7) of the single–sided (depicted as C) Low Energy Telescope (LET2). Table 2.2.40 summarizes the measured values. The variable names follow the structure: <side>_<species>_<quantity>, where, <side> stands for C; <species> stands for the particle species, and <quantity> represents Counts (not used in the variable names, in general), Flux or Rate for those variables independent of range. The variable names for different ranges (R1 – R5) are of the form: <range><side>_<species>_<quantity>. For electrons, the structure is: <Electrons>_<range><side>. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R17) have the values integrated over all the available ranges (e.g., R1 to R7).
Examples: C_He (measured quantity is "count"); Electrons_R3C_Rate; R1C_He_Rate.

FILE: PSP_ISOIS-EPIHI_L2-LET2-RATES300

This file contains the 300 s cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for various particle species for ranges R1 & R26 (integrated over Ranges 2 – 6) measured by the single–sided (named C) Low Energy Telescope (LET2). The measured values are summarized in Table 2.2.41. The variable naming is: <range><side>_<species>_<quantity>, where, <range> denotes the range (R1 and R26), <side> stands for C; <species> takes one of the particle species; and <quantity> represents Counts (not used in variable names, in general), Flux or Rate. Variable names without ranges (e.g., A_C) or with double digit range (e.g., R25) have the values integrated over all the available ranges (e.g., R2 to R5).
Examples: R1C_NetoSi_SECT_Rate; R25C_CNO_SECT_Flux.

FILE: PSP_ISOIS-EPIHI_L2-LET2-RATES3600

This file contains the 3600 s cadence data of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) for Al, Ar, C, Ca, Cr, Fe, H, He, Mg, N, Na, Ne, Ni, O, S and Si by the single sided (depicted as C) Low Energy Telescope (LET2). The measured values of these variables are summarized in Tables 2.2.42 – 2.2.49. The variables are named as: <side>_<species>_<quantity>, where, <side> stands for C; <species> represents the particle species; and <quantity> denotes Counts (not used in the variable names, in general), Flux or Rate. Variable names without ranges (e.g. C_Al) or with double digit range (e.g. R25) have the values integrated over all the available ranges (e.g. R2 to R5).
Examples: C_Si_Flux; PENB_C_Rate; R1C_32to50_Flux; Electrons_R5C.

FILE: PSP_ISOIS-EPIHI_L2-LET2-RATES60

This file contains the 60 s cadence measurements of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) of Al, Ar, C, Ca, Cr, Fe, H, He, Mg, N, Na, Ne, Ni, O, S and Si coming from sides A and B made by the Low Energy Telescope (LET1). The values of these variables are summarized in Tables 2.2.33 – 2.2.39. The variables are named as: <side>_<species>_<quantity>, where, <side> stands for A or B; <species> stands for the particle species; and <quantity> represents Counts (not used in the variable names, in general), Flux or Rate. Variable names without ranges (e.g. A_C) or with double digit range (e.g. R25) have the values integrated over all the available ranges (e.g. R2 to R5).
Examples: A_C_Flux; PENB_C_Rate; R1A_32to50_Flux.

FILE: PSP_ISOIS-EPIHI_L2-SECOND-RATES

This file contains the 1 s cadence measurements of particle Counts, Flux (cm^{-2} sr^{-1} sec^{-1} MeV^{-1}) and Count Rate (counts/s) of Electrons and H for sides A and B for the double–sided High Energy Telescope (HET) and the Low Energy Telescopes (LET1), and the single–sided Low Energy Telescope (LET2). The values of these variables are summarized in Table 2.2.57. The variables are named as: <tel>_<side>_<species>_<quantity>, where, <tel> stands for HET, LET1 or LET2; <side> stands for A, B or C; <species> stands for the particle species; and <quantity> represents Counts (not used in variable names, in general), Flux or Rate.
Examples: HET_A_Electrons_Flux; LET1_B_H_Rate; LET2_C_H.

4.2.1.4 He4_Flux_ChanC He4 flux channel C (Ions1) ($cm^{-2}sr^{-1}sec^{-1}keV^{-1}$)
Size: 80 × 48 time-varying
`particle_flux>differential_directional_number`
Ion Composition mode.
Look_Direction_80 0 – 79 (80 bins)
He4_ChanC_Energy 73 – 18468 keV (46 bins)

OTHER DATA

4.2.2.1 C_CountRate_ChanD C count rate channel D (Ions2) (counts/sec)
Size: 80 × 48 time-varying
`particle_flux>differential_directional_number_rate`
Ion Composition mode. Corrected for deadtime.
Look_Direction_80 0 – 79 (80 bins)
C_ChanD_Energy 206 – 17518 keV (21 bins)

4.2.2.2 Fe_CountRate_ChanC Fe count rate channel C (Ions1) (counts/sec)
Size: 80 × 48 time-varying
`particle_flux>differential_directional_number_rate`
Ion Composition mode. Corrected for deadtime.
Look_Direction_80 0 – 79 (80 bins)
Fe_ChanC_Energy 440 – 20657 keV (42 bins)

4.2.2.3 HCI_ChanC HCI flow direction ChanC
Size: 80 × 3 time-varying

time-varying
`position>angle`
Angle between particle direction and nominal outward Parker Spiral, based on 400km/s solar wind and corotation breakdown at 10Rs.

OTHER SUPPORT

EPI-LO DECODER RING

We have produced a summary of the EPI-Lo data called the EPI-Lo Channel Definition "crib sheet". The intent is to guide the user from a description of physical measurements to specific data products. Note that this relationship is time dependent and Figure 4 only applies during the first three orbits (launch until 21 November 2019, LUT Regime Index = 1). The time dependence is due to instrument configuration changes (e.g., changing definitions of species and energy bins due to adjustment to lookup tables or LUTs) and unplanned changes (e.g., sensitivity variations or background increase due to dust impacts admitting more light).

Figure 4: EPI-Lo Decoder Ring.

The upper table in Figure 5 references only data products that include time-of-flight TOF measurements and the lower table references only measurements that employ the energy/solid state detector (SSD) system. Both have the same columns. The Mode identifies one of four instrument modes: Ion Composition (IC), Particle Composition (PC), Ion Energy (IE) or Particle Energy (PE), (PC and IE are not included in Release 1) which relate to the types of measurements made. The instrument can cycle through up to eight different mode intervals (slots) per second. Typically the slot pattern covers all four modes in an alternating pattern (e.g., IC,PE,IC,IE,IC,PE,IC,PC). The next column is the channel/rate name and the associated mnemonic. Different channels can measure multiple types of particles, so it is useful to provide a non-descriptive, but memorable, name for the different data products to help avoid confusion like "During this period the Electron data are mostly protons" in favor of 'During this period the [E] rates are mostly protons. The mnemonic and associated system is based largely on what we expect to see in each the given channel (e.g., [E] for electrons). The next column provides the official, descriptive label for each data type. The Channel ID provides the useful range and naming of individual channels associated with each data

type or sub group thereof. Species mass provides the species or type (or alternate information). The energy range associated with the channel ID list is given in keV and MeV/nuc (where applicable). The CDF data file needed to study the particles described on a given row are in the Logical Source. Within each file the variable name is given for physical units and counting rate. Finally, there are miscellaneous notes on each row in the last column. See Release Notes on details for variables and calibrated data products.
